

## ANNUAL FERTILIZER PROGRAM

PTM prides itself in the fact that we not only understand what it takes to have healthy turf on a golf course, but we know how to diagnose and treat struggling turf. One of the biggest parts of healthy grass is to ensure it is fertilized correctly. PTM has a very stringent fertilizing program to keep healthy grass going and more important, to stop underlying problems from coming to the surface. PTM will maintain proper nutrient levels and these levels will be monitored by an independent source (i.e. a soil laboratory, as agreed upon by both parties) It will remain PTM's responsibility to maintain healthy turf that holds the highest quality of color and density.

<b>FERTILIZER</b>																													
Greens	N	N			B		B		B			B		B			B		B			B		B			B		B
Tees			B				B						B					B					B					B	
Fairways				B						B															B				
Slopes			B				B						B										B						
Bunkers																				B									
Rough					B										B														B

**S** = **Nutrient Spray** - A blend of minor elements designed to foliar feed the winter overseeding.

**N** = **Granular Nitrogen** - These applications are designed to “wake up” the base Bermuda grass on the greens for a smooth spring transition. The fairways, roughs and slopes may receive applications of granular nitrogen, as well as liquid, to enhance color.

**L** = **Liquid Fertilizer** - During the winter months we continually feed the grass with liquid fertilizer distributed through the irrigation system.

**B** = **Granular Blend** - These complete blends will be designed from soil and/or tissue analysis in order to feed the plant what it needs to grow and correct any nutrient deficiencies.
